INTER-VOIVODSHIP DIFFERENTIATION
OF MASS INDICES OF COLLECTED DOMESTIC WASTES

Key words: households, mixed wastes, municipal wastes, separated wastes, towns, villages, voivodships

Summary

Based on the GUS statistical data from 2010 it was shown that only part of population is served by waste collection. Least people is served in lubelskie and podlaskie voivodships and most – in dolnośląskie voivodship. Mean per capita mass of collected wastes is 250 kg including 20 kg of separated and 230 kg of mixed wastes. The mass varies among voivodships – from c. 160 kg·M⁻¹ in lubelskie voivodship to c. 350 kg·M⁻¹ in dolnośląskie voivodship.

Mean per capita mass of wastes collected in towns is 300 kg, in villages – c. 130 kg. Most mixed wastes is collected in dolnośląskie voivodship (c. 380 kg·M⁻¹), the least – in świętokrzyskie voivodship (c. 240 kg·M⁻¹). The mass of wastes collected in villages is more differentiated among voivodships. The least wastes (c. 50 kg·M⁻¹) is collected in villages of lubelskie voivodship and most (c. 180 kg·M⁻¹) in villages of lubuskie and dolnośląskie voivodships.

One should expect that due to a novel act on cleanness in communes and to other acts, the indices of collected wastes presented in this paper will significantly change.
